

Abstract

This document[HU, 2011] aims at providing a quick template for lecture notes. Along with this tex file, you'll find a ".bib", "Makefile", "commands.tex" in the same directory.

1 Introduction

This small portion of article shows the hint label. You can create as many hints as you like using this template.

1.1 Layout

Along with this tex file, you'll find these files:

- `hpl-ln-temp.bib` : the bibliography database
- `Makefile` : if you have linux programing experience, you must be familiar with this file. ^_^
- `commands.tex` : this file provides a new set of commands that will be helpful to take note

1.2 Compile

Much simpler than any tutorial! Just type:

```
make
```

Feel it disgusting to delete temporary files manually? Try this:

```
make clean
```

Your world is clean.

2 Conclusion

This is conclusion.
